1 Project Definition

People like Chess and need a way to quickly develop and practice new strategies. I love Chess!!! Chess Editor will let people play Chess on their PC and set up the board the way they want to test different strategies, or just play in a different way. It will support playing against an AI, or playing against another person locally. It will include an account system to track wins and losses. For the purposes of testing, there will be an undo and redo button, as well as tools to set up specific board scenarios. It will be programmed in Typescript and we will use Stockfish for the AI.

2 Project Specification

2.1 Focus

This project has a focus on developing experience with Angular and with a client-server application. This project will attempt to utilize open-source projects when it is reasonably possible.

2.2 Development Environemnt

2.2.1 Libraries

This project will be using the Google Identity API for user Authentication.

2.2.2 Frameworks

This project will be developed using the Angular framework (11.1.2) with TypeScript.

2.3 Platform

This project is going to be web-based application,

2.4 Genre

This project is considered as an online board game.

3 Project Requirements

3.1 Functional

3.1.1 Primary Requirements

The primary soce of functionality for / Chess Editor / include:

- Ability for the user to play an online game of chess with another user, or alternatively against **AI** that will be provided,
- Ability for the user to track their **statistics** of play over the life of their account; such as:
 - Wins
 - Losses
 - Draws
- Ability for the user to modify the starting layout of the chess pieces to match the configuration of either a previously ongoing game or a chess scenario.

3.1.2 Secondary Requirements

The secondary scope of functionality for Chess Editor include:

- Ability for the end user to create an account to access features
- Ability for the end user to login via their Google Account credentials.

3.1.3 Optional Requirements

3.2 Usability

3.2.1 TODO User Interface

The user interface of the application must not be obtrusive and needs to be adapted for mobile devices.

3.2.2 TODO Performance

The performance of the application must not interfere with other processes on the users system.

3.3 TODO System [0/1]

3.3.1 TODO Hardware

- 1. Severside All server-side requirments will be provided by the hosting site: ecowebhosting.co.uk
- 2. Clientside The application will require hardware capable of running a modern web-brower without difficulty.

3.3.2 Software

- 1. Clientside The application will require a modern web-browser preferably one of the following:
- 2. Serverside

3.3.3 Database Verify

This project will have one database which is used to keep track of on-going games. This is specifically MySQL version 10.4.14.

3.4 Networking

All project artifacts and interconnectivities are provided by the hosting server.

3.5 Security

For Google Authentication, we will be leveraging the Google OAuth 2.0 API. The other security requirements are inherently provided by the hosting server.

4 System Design

4.1 Subsystem Identification

We will be leveraging our MySQL database engine to create, update, read, and delete user information. Google Identity will also be used to facilitate

account creation with a user's exsisting Google account.

4.1.1 Chess Gameplay

The MySQL database engine will be used for tracking gameplay metrics. The Angular framework will be implemented with TypeScript to manage the gameplay logic and for validation of chess scenarios. The Stockfish AI framework will be used to respond to the end player's movement when playing against the "computer".

4.1.2 Subsystem Communication

The player will interact with the Chess UI with their keyboard and mouse. The player will notice a response from the UI with their monitor. The system should have proper UI responses indicating a success/failur of the attempted action.

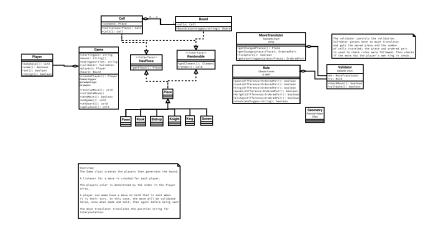

4.1.3 Sequence Diagram

@DeMO

:WHY: I have previously made the sequence diagram, but I have had to redo it a couple times as we have continued, the design has changed. I am going to just upload an complete sequence diagram and since it doesn't have to be the same

4.1.4 Use-Case Diagram

4.1.5 Class Diagram@Dakota:@Tyler:@DeMO:@pawilliamson

4.1.6 State Diagram

4.1.7 Entity Relationship Model (E-R Model)

https://lucid.app/lucidchart/b4d167c8-e8fa-475e-9e63-86c4e3aed414/view?page=0_0#

- 4.2 Design
- 4.2.1 Mock-up Diagram
- 4.2.2 Color Schemes
- 4.2.3 TODO Additional Comments

We will be using Bootstrap framewwork.

- 4.3 Sub-System Communication
- 4.3.1 Controls
- 4.3.2 I/O
- 4.3.3 Dataflow

@Tyler

- 4.4 TODO Entity Relationship Model (E-R Model)
- 4.5 TODO Overall operation System Model
- 4.5.1 Account Creation Management

The user will modify their account information via the Chess Game UI that will be fed into their respective records in the database.

4.5.2 Chess Gameplay Management

Gameplay metrics will be automatically tracked by the Chess Game UI in tandem with pre-existing records stored in the MYSQL database. Gameplay involving the "computer" will be handled by the Stockfish AI program to determine the next best move. https://lucid.app/lucidchart/invitations/accept/18b1143a-20e9-441c-ac34-2c95f7a2d031

5 TODO System Analysis

5.1 Subsystems

- Account Creation/Management
- Chess Gameplay Management

5.2 System (Tables and Description)

5.2.1 Data Dictionary

 $\label{lem:https://lucid.app/lucidchart/b4d167c8-e8fa-475e-9e63-86c4e3aed414/view?page=0_0\#$

5.2.2 Process Models

https://lucid.app/lucidchart/7d69e18e-721a-43ad-a77d-83df4e8d1f3a/view?page=0_0#

5.3 Algorithm Analysis

5.3.1 Big-O Analysis

We expect that the game when not playing with an AI will run in constant time as there is nothing in our current algorithms that will execute a variable number of times. This will probably change when the AI is implemented.

6 TODO Project Scrum Report

- 6.1 Overall
- 6.2 Product Backlog
- 6.3 Sprint Backlog
- 6.4 Burndown Chart
- 6.5 Sprint 1

Sprint 1 began on January 22, 2021 and continued to Febuary 6, 2021. The period lasted one day longer than the allocated duration.

6.5.1 Scrum

During sprint, two scrum meetings took place

- January 28, 2021: Discussed the framework of the project and decided to use Angular. Discussed the scope of the project and decided to be a web application. Discussed authentication services for the server.
- February 4, 2021: Discussed some work that was done since the previous scrum; includes diagrams and investigations of Google Authentication viability for the server.
